

Function #1:

This function was pretty simple, but I had a hard time placing the correct variables in the code and had to ask the consultant for a bit of advice which helped.

Function #2:

I found this function extremely hard mainly because once I fixed all the syntax and basic errors, I couldn't figure out what to do next and had to talk a lot with the consultant. Eventually, I got past the logical errors which presented more errors which took me a long time to figure out and had to consult with the consultant again. Finally, I was able to get the program to properly work and was very happy about it, overall debugging is my least favorite part about coding.

Function 3#:

This function wasn't too hard, but I did need to ask the consultant for some advice. Only took about 30 minutes to finished.

Main:

IT took me a bit to think about how to import the functions here but eventually I figured it out and then made the logic code to make sure the functions work, which wasn't too bad.
